Rekom High-Quality Raw Material for TORCH

T **Toxoplasmosis**
O **Other agents**
R **Rubella**
C **Cytomegalovirus (CMV)**
H **Herpes Simplex virus (HSV)**

TORCH refers to the main infectious agents capable of producing malformations in the fetus. It is an acronym that corresponds to the initials of (T)oxoplasmosis, (O)ther agents (HIV, Syphilis, etc.), (R)ubella, (C)ytomegalovirus and (H)erpes Simplex virus.

To diagnose this syndrome, series of tests are performed:

PREGNANT

Blood sample to determine specific IgM and IgG

FETUS

Umbilical Cord Blood Sampling (also called cordocentesis) to identify IgG, or isolate the parasite from amniotic fluid samples

BIRTH

Faced with the suspicion of congenital infection, performing placental tissue culture

NEWBORN

Blood sample to determine specific IgM and IgG
For clinical diagnosis of neurological complications: ultrasound, CT scan or MRI

At Rekom Biotech we have a wide range of recombinant antigens and antibodies for serodiagnosis of TORCH syndrome. In addition, we offer custom-made services of design and production of recombinant proteins to our IVD customers who want to develop a new assay but cannot find the right raw material in the market.
